

AmpliMag Mesh and Mesh Fixation System

Clinical Need

Over one million dental bone grafting procedures are performed annually in the US, most frequently before dental implant placement. In the most challenging grafting procedures, where there is a significant vertical deficit, even expert clinicians face revision rates reaching 25% due to the difficulty of reliably regenerating sufficient bone for implant placement. Currently used barrier membranes, meshes and fixation systems are unable to offer the form-stability needed to protect healing grafting sites from mechanical insults, while also offering resorbability and gingival tissue friendliness. The inability of regenerative products to offer these three features result in dental bone grafting procedures that are highly technique-sensitive, prone to adverse events, and require invasive removal procedures.

Solution

The AmpliMag Bone Grafting System provides the form-stability and gingival-tissue friendliness needed to minimize adverse events and maximize bone regeneration. The system is fully resorbable which eliminates the need to retrieve hardware following healing. The AmpliMag system is based on a patented magnesium alloy developed by nanoMAG and device designs developed at the University of Pittsburgh.

Competitive Advantage

No other barrier membranes or meshes offer both form-stability and resorbability which, taken together, enable maximization of alveolar ridge augmentation while obviating the need for device removal.

ITP Support

The ITP program has provided financial support for design, manufacturing, and benchtop and pre-clinical testing activities for the AmpliMag barrier membrane. Additionally, the Resource Center has provided expert clinical, market, regulatory, and quality advice.

Clinical Translation Pathway

Publications: Brown et al. Porous magnesium/PLGA composite scaffolds for enhanced bone regeneration following tooth extraction. [Acta Biomater 2015](#)

IP: US10,022,470 High Strength and Bio-Absorbable Magnesium Alloys

PCT/US2019/018545 Improved Magnesium Alloy and Process for Making the Same

Anticipated regulatory pathway: Device, 510(k) as 2 separate products (mesh/ fixation system)

Anticipated commercialization strategy: Emergence Dental, Inc. will partner with an existing dental regenerative or implant company on clinical adoption studies and distribution activities.

Michigan-Pittsburgh-Wyss Regenerative Medicine Resource Center is supported in part by the National Institute of Dental & Craniofacial Research of the National Institutes of Health under Award Number U24DE026915 and U24DE029462. nanoMAG

“Emergence Dental was founded to combine biomaterial intellectual property from nanoMAG and University of Pittsburgh to address unmet needs in dental bone regeneration. The Resource Center has enabled us to accelerate the development of the AmpliMag Mesh and Fixation System not just with funding, but with expertise that we have not been able to access elsewhere.”
